

⚠ ROUTE 7 • AUTOMOTIVE AI

THE AI ROAD TRIP

7 self-driving-car
AI systems. Built
from scratch in 7
days. Zero jargon
required.

Swipe to take Exit 01 →

EXIT 01 • PERCEPTION

Trains with six eyes, drives with one

This AI learns using all 6 onboard cameras — a full 360° view — but drives using just the front, staying just as fast.

Like a pilot who trains on every instrument, then flies using just the essentials.

EXIT 02 • PERCEPTION + PLANNING

One brain instead of two arguing

One AI that sees the road AND decides what to do — instead of two AIs translating thoughts back and forth.

Like a driver who can see the map, instead of one following shouted directions.

Fewer "lost in translation" moments

Qwen-Drive-1.0

EXIT 03 • RADAR PERCEPTION

Spots danger without knowing its name

This radar system flags anything that's moving — even things it was never trained to recognize.

Like noticing a rustling bush in the dark — you don't need to know what's there to slow down.

**EXIT 04 · PLANNING + SAFETY TESTING**

The driver and the stunt coordinator

One AI that can drive safely, or invent dangerous crash tests for other cars — same brain, different instructions.

Like an actor playing the hero in one scene, the villain in the next.

EXIT 05 • CLOSED-LOOP LEARNING

Better than any human it ever watched

An AI "coach" practices with god-mode info in simulation, then teaches everything it learned to the real car.

Like a rookie athlete studying film from a coach who had instant replay.

**EXIT 06 • SAFETY TESTING**

Scripts the crash backward from the impact

This AI decides where a crash would happen first, then invents a believable lead-up to it.

Like a stunt coordinator who designs the crash shot, then the chase scene.

**EXIT 07 • PERCEPTION + FORECASTING**

Predicts the future by quizzing the past

This AI also has to guess where cars and people just came from — that homework sharpens its future predictions.

Like a driver who clocks where a jaywalker came from, not just where they're headed.
